Don’t understand Statistics? This class will help you learn how to apply statistical methods to psychological research, including basic descriptive statistics, hypothesis testing, and correlation.

Course Objectives:

- To teach the basic concepts and formulas of statistical methods used in psychology. By the end of the semester the student should be able to perform the basic statistical procedures expected of undergraduate psychology students.
- To develop a sufficient understanding of statistics for the student to become an informed reader of statistical analyses. Statistics plays an important role in modern life and is a fundamental tool of inquiry in the field of psychology. Even if the student does not have to perform statistical procedures after this course he or she will benefit from having the ability to evaluate the statistical work of others.

This is an online course, which does not meet in-class.
